

DatingApp API Failure Report

Server: http://168.144.95.58:9395 | Date: 2026-08-12

Scope: 68 endpoints smoke-tested with valid JWT

1. Serialization Bug - Breaks 6 Endpoints (Priority: High)

One root cause - Hibernate lazy-initialization of the User.payments collection outside an open session - breaks 6 endpoints. All return HTTP 400 with the same error:

"Could not write JSON: failed to lazily initialize a collection of role: com.dta. Dating_App. entitys. User. payments: could not initialize proxy - no Session"

POST /users/filter

Status: 400

Cause: Lazy-init User.payments serialization bug

Detail: User search/filter is unusable - core discovery feature

GET /location/current/{userId}

Status: 400

Cause: Lazy-init User.payments serialization bug

Detail: Returns current location of a user

GET /location/history/{userId}

Status: 400

Cause: Lazy-init User.payments serialization bug

Detail: Returns location history of a user

GET /privacy/details?userId=

Status: 400

Cause: Lazy-init User.payments serialization bug

Detail: Privacy settings detail view

GET /notification?userId=

Status: 400

Cause: Lazy-init User.payments serialization bug

Detail: Notification list for a user

GET /support/status?status=OPEN

Status: 400

Cause: Lazy-init User.payments serialization bug

Detail: Support ticket list by status

2. Unreachable Endpoints (403 even with valid token)

PUT /notification/read?notificationId=

Status: 403

Cause: Route registration broken

Detail: Spec declares {notificationId} as path template but as query param; endpoint never matches

POST /razorpay/webhook

Status: 403

Cause: Auth handling broken

Detail: 403 even with X-Razorpay-Signature header and JSON body; webhook cannot be received

3. Validation / Logic Bugs

PUT /users/{userId}/profile-photo/{imageId}

Status: 400

Cause: 'Invalid image' for valid image ids

Detail: Image id 50 exists in GET /users/SA1000/images but is rejected as profile photo

POST /connections/send

Status: 500

Cause: NullPointerException - no validation

Detail: Missing senderId -> 'Cannot invoke String.equals(Object) because senderId is null'

POST /subscriber/activate

Status: 400

Cause: Raw DB constraint error on duplicate

Detail: Re-activating same plan surfaces 'Duplicate entry UK8c0uhesq6q9u4ur7givn6u6pl' instead of friendly message

4. Data / Privacy Concerns

- GET /dashboard/recent exposes raw mobile numbers of all users in the response.
- Dashboard user objects have no string userId field (only numeric id), so the app cannot navigate to their profiles - backend data gap.
- PUT /users/{userId}/profile-photo/{imageId} rejects valid image ids (see section 3).

5. Recommended Fixes

1. Fix lazy User.payments serialization (add @Transactional to read endpoints, use DTO projections, or @JsonIgnore on payments). Fixes all 6 endpoints in section 1 at once.
2. Fix PUT /notification/read route registration (path vs query param mismatch).
3. Review POST /razorpay/webhook auth handling - webhooks must be exempt from JWT.
4. Validate senderId/receiverId in POST /connections/send before use (avoid NPE).
5. Catch duplicate-key exception in POST /subscriber/activate and return a friendly message.
6. Fix profile-photo validation to accept existing image ids.
7. Remove/redact mobile numbers from /dashboard/recent.
8. Add a string userId field to dashboard user objects.
